PRIVATE ADMIN LOGIN & DOCTOR CONSULTATION ADMIN DASHBOARD

Bolt.new Master Prompt — Existing Project Modification

MASTER PROMPT — PRIVATE ADMIN LOGIN AND DOCTOR CONSULTATION ADMIN DASHBOARD

Modify my EXISTING Doctor Consultation application inside the SAME Bolt.new project.

I want a separate private Admin Sign-in page and an Admin Dashboard connected to my existing Doctor Consultation application and database.

Do not rebuild my application or create duplicate features.

1. SEPARATE PRIVATE ADMIN SIGN-IN PAGE

Create a separate private Admin Sign-in route: **/admin/login**

Requirements:
• Admin Sign-in must be separate from normal doctor and patient sign-in.
• Do not display Admin Login on public registration pages.
• Do not display Admin Login on normal sign-in pages.
• Do not add an Admin Registration option.
• Do not show admin options in doctor or patient dashboards.
• Keep the existing doctor and patient sign-in designs unchanged.
• Create a professional, simple Admin Sign-in page.
• Include Admin Username, Admin Password, Sign In button and password visibility control.

2. PRECONFIGURED ADMIN CREDENTIALS

Configure one authorized administrator account.

Admin username: KHBV.D Prajwaladmin_15

Admin password: KHBV.D doctorsconsultant_14

Requirements:
• No admin registration required.
• No sign-up option or public account creation.
• Only the pre-authorized administrator can log in.
• Validate credentials securely on the server.
• Store the password as a secure hash.
• Use protected backend environment secrets.
• Never hardcode credentials in frontend JavaScript or expose them in browser network responses.
• Add secure session management, logout, login rate limiting and brute-force protection.

These credentials are initial setup values. Configure them securely through backend secrets.

3. ADMIN LOGIN REDIRECTION

When I visit **/admin/login** and enter the correct credentials:
1. Authenticate the administrator.
2. Create a secure admin session.
3. Redirect directly to **/admin/dashboard**.
4. Display the Admin Dashboard.

Do not ask me to register or create another account. If credentials are incorrect, show an Invalid Username or Password message. If a normal doctor or patient tries to access /admin/dashboard, deny access. If the admin session expires, require admin sign-in again.

4. ADMIN DASHBOARD — EXACTLY 10 MAIN STATISTICS

Display exactly these 10 statistics at the top of the Admin Dashboard:

1. Total Doctor Applications — Total doctor applications submitted.
2. Total Registered Users — Combined number of doctors and patients.
3. Total App Downloads — Actual tracked application downloads or installations.
4. Pending Doctor Applications — Applications waiting for admin approval.
5. Approved Doctors — Total approved doctors.
6. Total Patients — Total registered patients.
7. Today's Appointments — Total appointments scheduled today.
8. Today's Consultations — Total consultations today.
9. Today's Completed Calls — Completed audio and video calls today.
10. Today's Text Consultations — Text consultation activity today.

Keep exactly these 10 main statistics. Do not add extra main statistic cards or unnecessarily redesign the dashboard. Use actual database records. If download tracking does not exist, implement proper tracking or show Not Available until data exists. Never invent numbers.

5. CONNECT MY EXISTING DOCTOR REGISTRATION AND APPLICATION FORM

My existing Doctor Consultation application already has a Doctor Registration option and application form.

Do NOT create a new doctor registration form or another application submission page.

Reuse my existing:
• Doctor Registration option.
• Existing application form and fields.
• Existing Submit Application button.
• Existing database connection and submission workflow.

Required automatic workflow:
1. Doctor opens my existing Doctor Consultation application.
2. Doctor selects the existing Doctor Registration option.
3. Doctor fills in the existing application form.
4. Doctor presses the existing Submit Application button.
5. The submitted application is saved using the existing database workflow.
6. That same application automatically appears in the Admin Dashboard under Doctor Applications.
7. Admin clicks View Details to see the complete submitted application.
8. Admin can Accept or Reject the application.
9. The decision updates the existing application record and status.
10. Only approved doctors become available in the patient-facing doctor directory.

Do not create duplicate applications or duplicate doctor records.

6. DOCTOR APPLICATIONS — VIEW, ACCEPT OR REJECT

Create a Doctor Applications table connected to the existing submitted applications.

Display:
• Application ID
• Doctor Name
• Mobile Number
• Email Address
• Specialization
• Qualification
• Medical Registration Number
• Application Submission Date
• Application Status
• View Details button

When I click View Details, show all information submitted through the existing form: personal details, contact information, qualifications, medical registration details, specialization, experience, clinic or hospital information (if collected), uploaded certificates and documents, and application submission date.

At the bottom provide:
ACCEPT APPLICATION

REJECT APPLICATION

When accepted, update the existing application status to Approved, update the doctor's existing account or profile status, and make the approved doctor available in the patient-facing doctor directory.

When rejected, allow the admin to enter a rejection reason, update the existing application status to Rejected, and keep the application record available for admin review.

Preserve all previously submitted applications.

7. ALL REGISTERED USERS

Create an All Users section for doctors and patients.

Display:
• User ID
• Full Name
• User Type (Doctor / Patient)
• Mobile Number
• Email Address
• Registration Date
• Account Status
• Total Appointments
• Last Login

Include search and filters for user type, registration date and account status. Clicking a user should display their available account details.

8. DOCTOR PERFORMANCE, CALLS, MESSAGES AND EARNINGS

Create a Doctor Performance table.

For every doctor, display:
• Doctor Name
• Mobile Number
• Total Appointments
• Today's Appointments
• Total Audio Calls
• Today's Audio Calls
• Total Video Calls
• Today's Video Calls
• Total Text Consultations
• Today's Text Consultations
• Total Completed Consultations
• Total Earnings
• Today's Earnings
• Pending Payments
• Doctor Account Status

When I click a doctor, show their detailed appointment, call, message and payment history.

Count actual completed calls and consultations. Distinguish completed calls from missed, failed or cancelled calls. Count text consultation sessions or messages consistently. Calculate earnings using actual successful payment records. Show doctor earnings separately from platform commission. Exclude failed, cancelled and refunded payments from successful earnings.

9. TODAY'S APPOINTMENTS

Create a Today's Appointments section.

Display:
• Appointment ID
• Patient Name
• Doctor Name
• Appointment Date
• Appointment Time
• Consultation Type (Audio / Video / Text / In-person, if supported)
• Payment Status
• Appointment Status

Show the total appointments scheduled today. Allow filtering by doctor, appointment type and appointment status.

10. CUSTOMER SUPPORT REQUESTS

When a patient submits a support request through my existing application, it must automatically appear in the Admin Dashboard.

Display:
• Request ID
• Customer Name
• User Type (Doctor / Patient)
• Mobile Number
• Email Address
• Issue Category
• Issue Description
• Request Date and Time
• Request Status

Admin must be able to open and read the complete request, reply to the customer, view previous support conversations, and mark requests as Pending, In Progress or Resolved.

11. DOCTOR REQUESTS AND PROBLEMS

Create a separate Doctor Requests and Issues section.

Show requests submitted by doctors, including payment and earnings problems, appointment problems, login problems, profile verification problems, audio and video call problems, text consultation problems, technical issues and other requests.

Display:
• Doctor Name
• Mobile Number
• Email Address
• Issue Category
• Full Issue Description
• Submission Date
• Priority
• Request Status

Allow admin to open requests, reply to doctors, update status and track resolution.

12. ADMIN DASHBOARD NAVIGATION

Create these sections:
1. Dashboard Overview
2. Doctor Applications
3. All Doctors
4. All Patients
5. All Users
6. Doctor Performance
7. Today's Appointments
8. Consultations
9. Payments and Earnings
10. Customer Support
11. Doctor Requests and Issues
12. Admin Activity Logs
13. Settings
14. Logout

Keep the design clean, professional and responsive on mobile and desktop.

13. EXISTING DATABASE AND AUTOMATIC CONNECTION

Use my EXISTING Supabase project and database.

Before coding, inspect the existing database schema and identify existing doctor registration and application tables, doctor and patient records, appointment records, audio/video/text consultation records, payment and earnings records, and customer support and doctor request records.

Requirements:
• Reuse existing tables and records.
• Reuse existing form fields and submission functions.
• Do not create duplicate application forms.
• Do not create duplicate doctor or patient records.
• Create only genuinely missing database fields or tables when necessary.
• Ensure new applications automatically appear in the Admin Dashboard.
• Ensure support requests and doctor issues automatically appear.
• Ensure statistics update from actual records.
• Use secure Row Level Security and backend admin authorization.

14. SECURITY AND EXISTING APP PRESERVATION

• Keep existing doctor and patient authentication working.
• Keep existing registration and sign-in pages unchanged.
• Do not change existing appointment or payment logic unnecessarily.
• Protect patient information and medical records.
• Store uploaded doctor documents securely.
• Record important admin actions in audit logs.
• Never expose the Supabase service-role key in frontend code.
• Never expose admin credentials.
• Deny doctors and patients access to admin data.

15. FINAL IMPLEMENTATION INSTRUCTIONS

I want a private Admin Sign-in page and a complete Admin Dashboard inside my existing Doctor Consultation project.

Required workflow:

Existing Doctor Registration → Existing Application Form → Existing Submit Button → Existing Database → Admin Dashboard → View Details → Accept or Reject.

Do not create a new doctor application form. Keep exactly 10 main dashboard statistics.

Do not rebuild my existing application, change existing user interfaces unnecessarily, delete data or create duplicate database records.

First inspect my existing project and database. Explain which existing tables and functions will be reused, then implement these changes carefully.

IMPORTANT SECURITY NOTE

The credentials above were shared in this conversation. Replace the password with a new secret before public deployment and configure it as a secure backend secret.
